IDENTIFIERS *Cohort Survival Procedures; *South Carolina

ABSTRACT

This publication is produced to give some insight into the enrollment trends for the state of South Carolina and for its individual school districts. Various charts and tables are presented in an effort to make the projections useful to educators in developing plans for the future. Figures show the total state enrollment for grades K-12 between 1975-76 and 1985-86, as well as for private and public school enrollment for the same grades and time period, and for public school enrollment for that time period for grades K-6, 7-8, and 9-12. Tables show public and private school enrollment between 1975-76 and 1985-86; public school enrollment by grade for that period; a summary of 180-day enrollment for public schools by district and year between 1975-76 and 1985-86, as well as 180-day enrollment for each year between 1978-79 and 1985-86; fall enrollment for private schools by county and year from 1975-76 through 1978-79; and a comparison of actual and projected enrollments by district. End-of-the-year enrollments by grade and fall 45-day average daily memberships for 1978 and 1979, by grade as reported to the department of education, were used in conjunction with the cohort survival procedure in deriving the public school enrollment projections. and
Pamela P. McMillan, Data Management Research Analyst

INTRODUCTION

This publication is produced primarily to give some insight into the enrollment trends for the State and school districts. Various charts and tables are presented in an effort to make the projections useful to educators in developing plans for the future. The enrollment projections for South Carolina public schools presented in this publication indicate a decline of 3.8% in total State enrollment from 1978-79 (643,079) to 1984-85 (618,400) with a slight increase to 618,800 for 1985-86.

End-of-the-year enrollments by grade and fall 45-day average daily memberships for 1978 and 1979 by grade, as reported to the Department, were utilized in conjunction with the cohort-survival procedure in deriving the public school enrollment projections. Enrollment projections for individual districts were rounded to tens while the State projections were rounded to hundreds. Due to this rounding procedure, the sum of projections by grade may not equal the district total and the sum of the district totals may differ slightly from the State total.

All statewide figures illustrated in this booklet exclude Felton Laboratory School and South Carolina Youth Services Institutions. Enrollments for ungraded and self-contained special education classes were distributed into appropriate grades in the tables contained in this report. The cohort-survival procedure also was employed in the development of the private school enrollment projections.

Caution should be exercised by all users of the projections illustrated in this publication as they are dependent upon the constancy of the survival ratios. All projections will continue to be updated each year as new enrollment data are received and compiled by the Department.

PROJECTED TRENDS

Public School Enrollment Projections

The State public school enrollment projections indicate a general declining enrollment trend through the 1984-85 school year. A slight increase in enrollment is expected during school year 1985-86.

A review of the projected enrollments by grade indicates that a general decline in enrollment will continue through the 1985-86 school year for Grades K-6. Little change is expected between 1978-79 and 1980-81. The enrollment in Grades K-6 will fall sharply between the 1980-81 and 1983-84 school years. A leveling will occur after 1983-84, as shown in Figure 3 on page 4.

For Grades 7 and 8, enrollment figures peaked during the 1976-77 school year. A decline is projected for these grades for 1977-78 through 1980-81 and then an increase is projected for 1981-82 through 1983-84 followed by a decline during 1984-85. See Figure 4 on page 4.

Enrollment in Grades 9-12 peaked during the 1977-78 school year. A decrease is projected thereafter for the school years 1978-79 through 1983-84 followed by an increase during 1984-85. See Figure 5 on page 5.

Of the 92 districts, 34 (37%) are projected to have steadily declining enrollments from the 1978-79 school year through the 1985-86 school year. In addition, 28 districts (30.4%) are projected to show a decline in enrollment over this time span as a whole, although one or more of the interim years are projected to have slight increases in enrollment.

Twelve school districts (13.0%) are projected to have consistently increasing enrollments from 1978-79 through 1985-86. Eighteen districts (19.6%) are projected to show increases in enrollment over this time span, but are projected to show some decreases for one or more of the interim years.

The following seven school districts are projected to have substantial increases in enrollment from 1978-79 to 1985-86:

District	Percent Increase	Enrollment 1978-79 - 1985-86
Anderson 1	13.8	5,661 - 6,440
Berkeley	11.0	23,063 - 25,600
Dorchester 2	23.5	10,021 - 12,380
Georgetown	8.2	9,872 - 10,680
Lexington 1	9.9	8,207 - 9,020
Lexington 5	17.5	10,088 - 11,850
Richland 2	9.8	11,026 - 12,110

Private School Enrollment Projections

Due to the instability of private school enrollment which has been exhibited in various counties over the years, enrollment at the county or grade level cannot be estimated closely.

One trend which is evident, for the state as a whole, is that there has been an increase in total private school enrollment over the past five years. This trend is projected to continue through 1985-86 with the state total indicating an increase in enrollment each year. See Figure 2 on page 3.

PROCEDURES USED FOR ENROLLMENT PROJECTIONS

Public School Enrollment

COHORT-SURVIVAL PROCEDURE

The procedure currently used for projecting public school enrollment for Grades 2-12 in South Carolina school districts is referred to as the cohort-survival procedure. This procedure is probably the most widely used for making short-range enrollment projections. The procedure currently does not utilize kindergarten enrollment. Kindergarten projections are explained later in this section.

The data requirements for implementation of the cohort-survival procedure are 1) projected first grade enrollments for each year of the projection period, and 2) a matrix of grade-to-grade survival ratios. A survival ratio is the quotient obtained by dividing the enrollment of one grade for a school year into the enrollment of the next higher grade a year later. The survival ratios are different for each school district and for each grade level. However, the survival ratios for a given grade level and district tend to remain relatively constant from year to year.

There are some cases, however, when the survival ratios change dramatically from one year to the next. For example, a small school district could experience a large percent change in enrollment due to the opening or closing of an industrial plant within the district. Legislative decisions could also affect enrollments in some districts. Generally, the survival ratios are close to one. A survival ratio less than one indicates the net

effects of out-migration, deaths, nonpromotions, dropouts, and transfers to private schools. A survival ratio greater than one indicates the net effects of in-migration, promotions, and transfers from private schools.

For the State of South Carolina (all districts combined) the grade-to-grade ratios for Grades 1 to 2, 3 to 4, 7 to 8, 9 to 10, 10 to 11, and 11 to 12 were less than one and for Grades 2 to 3, 4 to 5, 5 to 6, 6 to 7, and 8 to 9 were greater than one, based on five years of data.

MATRIX OF SURVIVAL RATIOS BY GRADE, AND BY DISTRICT FOR PUBLIC SCHOOLS

Prior to the 1978-79 school year, ungraded and self-contained special education enrollments were not included in the graded enrollment figures. The end-of-year ungraded enrollment was empirically distributed among Grades 1-8 for the school years 1976-77 and 1977-78. For the 1975-76 school year, ungraded enrollment was prorated among Grades 1-8 according to the percentages obtained from a survey on age-grade data conducted in the fall of 1975. Special education enrollment in self-contained classes was empirically distributed into the grades for the school years 1975-76 through 1977-78.

The end-of-year (180-day) enrollments for 1979-80 were projected by using the average ratio of 180-day enrollment figures to fall 45-day average daily membership (ADM) figures for the years 1976-77, 1977-78, and 1978-79 and applying it to the fall 45-day ADM of 1979-80. Extreme fluctuations in the ratios by district and grade were controlled by establishing upper and lower bounds.

The matrix of survival ratios was computed by dividing the enrollment of Grades 1-11 into the enrollments of Grades 2-12 of the succeeding year. An average was computed from five years of data.

PUBLIC FIRST GRADE ENROLLMENT PROJECTIONS

The matrix of survival ratios is used to project the enrollments in Grades 2-12 based on the enrollments in Grades 1-11 of the preceding year. The matrix does not, however, project the enrollment for the first grade. The first grade enrollment projections were based on: 1) the number of county births six years prior to the projection year (designated below as $B_{c+n-6)}$, and 2) the ratio obtained by dividing the most recent first grade enrollment for the county by the number of county births six years earlier (designated below as R_c).

One approach to projecting first grade enrollment is to assume that the first grade enrollment of a given year will be approximated by the number of live births six years earlier. If variables such as death and migration tend to balance, the formula for this projection is $E_{c+n}=B_{c+n-6}$, where:

c=current (or base) year

n=number of years into the projection period

E_{c+n}=projected enrollment for year c+n

B_{c+n-6}=births six years prior to year c+n.

Another approach to projecting first grade enrollment is to apply the ratio computed by dividing the most recent first grade enrollment by births six years earlier to the births of the more recent years. The formula for this projection is $E_{c+n}=R_cB_{c+n-6}$, where:

c=current year

$R_c = \frac{E_c}{B_{c-6}}$ = ratio of current first grade enrollment to births six years earlier

n=number of years into projection period

E_{c+n}=projected enrollment for year c+n

B_{c+n-6}=births six years prior to year c+n

Both ways of projecting first grade enrollments, as previously described, were tested for deviation from actual enrollment figures (errors). The tests were made using first grade enrollment data back to school year 1961-62 and county births back to 1955. In terms of county averages, the first formula ($E_{c+n}=B_{c+n-6}$) gave a relatively constant error factor for each year of the trial projection period. The second formula ($E_{c+n}=R_c B_{c+n-6}$) resulted in an error factor which increased as n (number of years into projection period) increased. The second formula gave better results than the first formula for n=1, 2 and 3 and less accurate results for higher values of n regardless of the base year (c). These findings led to a combination of the two formulas which produced better results for all applicable values of c and n. The combination selected is given by the formula $E_{c+n}=W_1 B_{c+n-6}+W_2 R_c B_{c+n-6}$ where R_c and B_{c+n-6} are as previously defined and where the weights W_1 and W_2 are defined by the following table for the various values of n.

n	W_1	W_2	W_1+W_2
1	.15	.85	1.00
2	.25	.75	1.00
3	.30	.70	1.00
4	.35	.65	1.00
5	.40	.60	1.00
6	.45	.55	1.00

This means that for the first year of the projection period, the projection B_{c+n-6} (100% births) is weighted at 15 percent and the projection

$R_c B_{c+n-6}$ (current percentage of births) is weighted at 85 percent of the total. Application of the preceding formula provided the first grade projections for each county. Finally, first grade projections by district were obtained by prorating the county projections according to the projected first grade enrollment of 1979-80.

There are, of course, other methods of projecting first grade enrollment. Some methods will give accurate results for some counties, and fail for others. A particular method applied to a school district may provide adequate estimates for a period of time, and then become useless in later years.

Caution should be exercised in using projected enrollments as forecasts, particularly those which are dependent upon the first grade projections. Some factors which may cause the projected enrollments to differ substantially from the actual first grade enrollments are: 1) the six-year time span between births and first grade enrollment, 2) migration of population, and 3) the method of allocating county births to districts within the county. Approximately one-half of the projected school enrollment for 1985-86 (Grades 1-6) is determined by the projected first grade enrollment. The first grade cohort of 1980-81 will progress to the sixth grade of 1985-86.

After having obtained the projected first grade enrollment figures and the matrix of survival ratios, the data requirements for projecting the enrollments for Grades 1-12 were satisfied. The survival ratios were applied consecutively to obtain the projected enrollments from 1980-81 through 1985-86.

PUBLIC KINDERGARTEN ENROLLMENT PROJECTIONS

Preparing children for entry into the first grade has been receiving increased attention by educational administrators in South Carolina during recent years. The public kindergarten enrollment has been increasing even in years when there were fewer five-year olds (as measured by births) in the State. For the past two years approximately 34,000 students have been enrolled in public kindergarten. In searching for a meaningful way to project public kindergarten enrollment, the percent of first grade pupils having attended public kindergarten programs in the previous year was analyzed, at the State and school district levels. The following data were compiled for the State:

School Year Kindergarten		First Grade	Ratio of Kindergarten Enrollment to First Grade Enrollment	Expressed as Percent
1976-77	to	1977-78	.6404	64.04
1977-78	to	1978-79	.6755	67.55
1978-79	to	1979-80	.7019	70.19
1979-80	to	1980-81	.7198	71.98

From the above sequence, it appears that there is a leveling off of the percent of five-year olds enrolled in public school kindergarten programs. Results from the Kindergarten Non-attendance Survey conducted by the State Department of Education during Fall 1979 indicated that approximately 94% of the first graders in public schools were served by some formal preschool education program (public, private, headstart, etc.). The computed percent of 1978-79 first graders who attended state-supported public kindergarten programs the previous year was 67.55, as indicated in the above table. This figure is expected to increase to approximately 72 percent for 1980-81. While 72 percent is a projected figure, it is based on actual fall kindergarten enrollment and projected first-grade enrollment which is calculated from the number of actual births.

Assuming that the percent of all first grade pupils in South Carolina with some type of formal pre-school training (either in public or private programs) will increase from 94 to 100 percent by 1986-87, an increase to approximately 75 percent is expected in the number of first grade pupils enrolled in public schools of South Carolina who have had pre-school training through state-supported kindergarten programs. Of course, as is the case now, there will be wide variations among the school districts in the latter percentage.

Kindergarten enrollment for 1979-80 was projected along with and in the same manner as the 1979-80 enrollment for Grades 1-12. For later years, kindergarten enrollment was projected by applying ratios to the first grade enrollment projections for each district. The ratios used were based on four years of data reflecting the percent of first grade pupils with public kindergarten training (first grade enrollment divided by the kindergarten enrollment for the previous year.)

Specifically, the four ratios for each district were obtained by dividing end-of-year kindergarten enrollment (for school years 1976-77 through 1979-80) respectively and end-of-year first grade enrollment for school years 1977-78 through 1980-81. Ratios for 1978-79 to 1979-80 and 1979-80 to 1980-81 were based on projected enrollments. The largest of the four ratios was selected for each district. The constant .003333 was added to the largest ratio cumulatively each year throughout the projection period. That cumulative addition reflects a slight and gradual increase in the projected percent of first grade pupils having attended public kindergarten. For most districts, the final projected increase was that of two percentage points. Adjustments were required for a few districts to prevent the projected percentage from exceeding 100 for any year in the six-year period.

The kindergarten projections for 1980-81 through 1985-86 were obtained by applying the computed ratio for each district and each year to the projected first grade enrollment of the following year. The projected first grade enrollment of 1985-86 was used to project kindergarten enrollment of that year since projections were not calculated for 1986-87.

COMPARISON OF ACTUAL AND PROJECTED PUBLIC SCHOOL ENROLLMENT

District enrollment projections were reported for 1978-79 in the May 1977 edition of this publication. At the time the 1978-79 projections were made, the latest available actual enrollment was for the 1975-76 school year. Upon receipt of the end-of-year enrollment for this past year from the school districts, a comparison was made of the actual figures with the projected figures for 1978-79. Kindergarten enrollment was not projected in 1977 and is therefore not included in the comparisons.

Table 13 on page 35 presents the projected and actual figures for 1978-79. The difference and the percent difference given in the table represent the error factor which was made in preparing the projections three years ago. Users at the district level may wish to consider the error factor for their individual district and for other districts of similar enrollment size.

The composite errors for districts in similar enrollment-size categories for 1978-79 are presented below:

District Enrollment Size	Number of Districts	Projected Enrollment 1978-79	Actual Enrollment 1978-79	Difference Number	Difference Percent
20,000 and above	5	171,788	174,162	-2,374	-1.4
10,000 - 19,999	10	125,555	128,601	-3,046	-2.4
5,000 - 9,999	23	178,712	180,547	-1,835	-1.0
2,500 - 4,999	21	73,154	73,554	- 400	-0.5

Private School Enrollment Projections

The cohort-survival procedure was used to obtain the private school enrollment projections given in Table 1 on page 6. The projections are given only at the state level.

Enrollments for the entering cohort (first grade), ungraded, special education, and kindergarten were assumed to remain constant. Survival ratios were computed from a five-year enrollment period for Grades 1-12. These survival ratios were applied to 1978 fall enrollment by grade to obtain the graded enrollment projections for fall, 1979. Then, the survival ratios were applied sequentially to the graded projections to obtain the projected enrollment by grade for subsequent years. Thus, projected totals were obtained for the school years 1979-80 through 1985-86.
